ABSTRACT OF THE DISCLOSURE

Disclosed is a device management network system that is capable of monitoring all abnormalities that has occurred in a network device. The device management network system includes a management server, client devices, and network devices to be managed. The management server, when receiving a device-details screen request from a certain client device running a Web browser, collects MIB objects from the printing device specified by the information in the device-details screen request. Then, the management server provides the client device with data which causes the Web browser to display the device-details screen containing information about all abnormalities that has occurred in the printing device.
